Network Printing: Building Print Services on Heterogeneous Networks Matthew Gast, Todd Radermacher

On today's networks it's common to have users running Windows, Apple, Novell, and many versions of Unix. Each operating system has its own printing facility and there is little or nothing in common between them--there is no single system for print spooling. Yet all users want to be able to print, and most of the time they have to share the same printers. The network administrator has to solve this problem as efficiently as possible.

O'Reilly's *Network Printing* shows network administrators a way out of this problem. It details how to set up a network printing system that's based on Linux, but can handle printing from Windows, Novell, Apple, and any version of Unix. To this end, it offers thorough discussions of the Unix printing facility (both LPR and LPRng); Samba's printer sharing; Netatalk, a free implementation of the AppleTalk protocol; and ncpfs, a Linux implementation of the Netware protocols. The book also shows how to get printers to boot correctly on a network, using solutions like bootp and DHCP; how to manage printers remotely using SNMP; and how to set up a network-wide printer configuration repository with LDAP.
